Acknowledgements

This toolkit has been developed with the input and involvement of a range of national and local general practice and pharmacy partners brought together in a National Implementation Group. We're very grateful for the collaboration with and expertise of those involved and look forward to continuing to work together over the coming months.

Foreword

I'm delighted to introduce the new General Practice referral pathway to the NHS Community Pharmacist Consultation Service (NHS CPCS) for minor illness patients this winter, which we believe will have a positive impact for general practice teams, community pharmacy and for our patients.

Community pharmacy teams are an integral, trusted part of the NHS, delivering high quality clinical services as a partner within local primary care networks.

The new service enables practice teams to channel defined minor illness patients directly to a community pharmacist for their first contact where they will receive clinical assessment and advice.

This toolkit provides resources and templates to support practices to work in their PCNs to implement the new service with Local Medical Committees, Local Pharmaceutical Committees and community pharmacy colleagues and with the support of the NHS England and NHS Improvement regional implementation leads.

There is good evidence that advice provided by community pharmacists about minor illness results in the same outcome as if the patient went to see their GP or attended an emergency department[1]. It is intended that the service will help to increase capacity within general practice for the treatment of patients with higher acuity conditions by making better use of the clinical skills of community pharmacists and offer great care from community pharmacy colleagues for our local population.

The NHS 111 Referral Pathway to the NHS CPCS was piloted and evaluated in stages over nearly three years, and successfully rolled out across England from October 2019. Currently 94% of all pharmacies are offering the NHS 111 service and therefore available to work in a similar way with general practices.

Working with a national reference group which includes the BMA and RCGP, we began piloting the GP referral pathway in July 2019. An evaluation of all pilot areas has shown the processes to be safe with high patient satisfaction scores and a significant reduction in the number of GP in-hours appointments.

Thank you for your support - we look forward to working with you to make it a success.

Dr Nikita Kanani MBE, Medical Director of Primary Care

---

1 Introduction

1.1 The NHS Community Pharmacist Consultation Service (CPCS) was launched by NHS England and NHS Improvement on the 29 October 2019, to progress the integration of community pharmacy into local NHS urgent care services, providing more convenient treatment closer to patients' homes.

1.2 The first phase of NHS CPCS offered patients the option of having a face-to-face or remote consultation with a pharmacist following an initial assessment by an NHS 111 call advisor. Following a period of successful piloting, the service is being extended from November 2020 to include referrals for minor illness conditions from general practice, as well as from NHS 111.

1.3 This toolkit is a practical guide on how patients can be referred to community pharmacists from general practice for minor illness conditions from general practices across a primary care network (PCN) footprint into the NHS CPCS. It follows a pilot scheme in several PCNs since June 2019.

1.4 If you are a General Practice or Primary Care Network (PCN) intending to enable the GP referral pathway, please read this toolkit which provides practical guidance to help with successful implementation

1.5 Local providers are responsible for clinical governance. It is recommended that discussions regarding the implementation of the pathway take place at a local PCN footprint level as a minimum to support consistency across geographies, and to facilitate communication channels with the pharmacies usually accessed by patients local to PCN practices. Appendix E provides further information on GP and PCN governance arrangements.

1.6 If you are a community pharmacist intending to provide the NHS CPCS, please read the 'Service Specification' and the 'Toolkit for Pharmacy Staff'.

2 Aims and Intended Outcomes

The aim of NHS CPCS is to:

2.1 Improve access for patients with minor illnesses and for those with higher acuity illnesses or complex health needs by facilitating quick and convenient consultations with the right healthcare professional in a way that is safe and effective.

2.2   Increase patient awareness of the role of community pharmacy as the 'first port of call' for minor illnesses and medicines advice and support the integration of community pharmacy into the primary care network team.

2.3   Identify ways that patients can self-manage their health more effectively with the support of community pharmacists.

2.4   Build and promote shared working within PCNs, creating improved relationships between practices and community pharmacies to deliver high quality and joined up care to patients.

2.5   Be cost effective for the NHS when supporting patients with minor illnesses.

3 Bristol, North Somerset and South Gloucestershire pilot

3.1   Bristol, North Somerset and South Gloucestershire (BNSSG) started piloting the General Practice referral to NHS Community Pharmacist Consultation Service (GP referral to CPCS) in July 2019, as part of the NHS England and NHS Improvement Pharmacy Integration Fund Programme

3.2   Key benefits and outcomes from the pilot showed:

- 4,028 consultations have been completed in the BNSSG area. 71% of patients received advice or advice and an over the counter product to manage their concern. In 12% of cases, the pharmacist identified that the patient required an urgent GP appointment which they were able to help arrange, and 17% of patients that consulted with the pharmacist were signposted to another health care professional, or back to the GP for a non-urgent appointment;

- patient feedback for those who have had a consultation with a pharmacist has been very positive;

- there has been an excellent response from practices willing to participate in the pilot and this interest is continuing to grow. This has been supported by having strong advocates of the service in GP practices;

- the pilot has developed and supported maturing relationships between community pharmacists and GP practices, ensuring that the patients in the local community are cared for jointly and practice teams better understand the role of the community pharmacist; and

- community pharmacists alert GP practices when they direct a patient back to the practice or on to other care settings, or where they believe there are other underlying issues that the practice should be aware of, building trust and the understanding that both have a responsibility for the care of patients.

3.3 Overview of the BNSSG pilot

3.3.1 In the BNSSG pilot, the reception team at the GP practice advises patients with minor illnesses, who have called to request a GP appointment, that they should attend a local community pharmacy for a consultation with a pharmacist and that if they agree, personal data, including a short description of their presenting condition, will be transferred to the pharmacist.

3.3.2 The patient is asked which community pharmacy they would like to attend and secure electronic transfer of data to support the referral, is sent from the practice to the community pharmacist.

3.3.3 When the patient arrives, the pharmacist carries out a clinical consultation, which will include viewing their summary care records and use of NICE Clinical Knowledge Summaries to identify any red flags, such as sepsis and the pharmacist will either then provide relevant clinical advice and support if there are no red flags, or will refer/escalate the patient to another service or healthcare professional, where appropriate.

3.3.4 All GP practices in BNSSG use the same clinical system and referrals are currently being made by several different methods including the use of a form embedded within the system, which pre-populates patient and referral data. The record is then saved in the patient notes and the template is copied and pasted into an nhs.net email account and sent to the patient's choice of pharmacy.

3.3.5 Pre COVID-19, the GP practices provided the details of the selected pharmacy to the patient, advising them to attend the pharmacy within 12 hours. If the patient didn't attend after 12 hours, the pharmacist would attempt to contact the patient a number of times and this data would be captured. Post COVID-19, the process has been changed slightly and practices now inform the patient that the pharmacist will contact them once they have received the referral and will decide whether to conduct the consultation over the phone or whether they need to invite the patient to attend the pharmacy.

3.4 BNSSG pilot results and outcomes

3.4.1 Dr James Case, GP, Concord Medical Centre, explains why his practice became involved with the pilot: "*We see constant requests throughout the week from patients wanting to see their GP, many with minor illnesses, which are more suitably addressed by a community pharmacist. We estimated between 5-10% of those patients would be better signposted to a community pharmacy for help instead.*

With training, our reception team was able to pick up on the sorts of illnesses that can more suitably dealt with by a community pharmacist. We have a good process in place for referring patients to see the pharmacist and 70-80% of the issues are resolved by

them. If during the consultation, the pharmacist identifies that the patient has a more complex problem, we will arrange to see them at the practice.

The Community Pharmacist Consultation Service has a real opportunity to help GP practices reduce our daily demand and manage our more complex patients, which is very valuable for us."

3.4.2   The outcomes in the BNSSG pilot area demonstrate that access to GPs for patients who really need a GP consultation has improved, by diverting those with minor illnesses to community pharmacists in a way that is convenient, safe and effective and enables those patients to be seen by an appropriate healthcare professional on the same day. The pilot also helped to relieve pressure on GP appointments and create some additional capacity for the practices.

3.4.3   Tom Gregory, Clinical Pharmacist, 168 Medical Group Practice says: "*It's been beneficial to have a formal referral route to community pharmacists and it's really helped the work I've been doing within the practice to promote self-care. I hope that patients will consider visiting a pharmacy first in future – many patients don't realise the range of conditions that pharmacies can manage, whether they need just need advice, or an over-the-counter medicine.*"

3.4.4   Debra Spencer, Practice Manager, Birchwood Medical Practice, adds: "*When we refer our patients to a pharmacist, we provide as much information as possible to help them and we find that we get just as much information back from the pharmacist after they have seen the patient. The pharmacist can also pick up on emergency situations and arrange the appropriate care.*

The pilot is working really well for us and means a great deal to our surgery team, freeing up appointments to enable our GPs to focus on more complex cases. It is also great that the patient has had the education of right healthcare professional at the right time and that self-care and their local pharmacist is where they look first, before they come to their general practice."

3.4.5   Care navigation training has been provided to practice staff across the BNSSG pilot area, so they fully understand the benefits of the service to their practice and to patients. Prior contact with pharmacies before 'going live' with the pilot has built confidence and understanding in the service amongst reception teams and pharmacists alike and ensures that the service they deliver is of the highest standards. This training for receptionists also includes advice on how they can explain the service to patients who do not understand that a community pharmacist can clinically assess their minor illnesses.

3.4.6   Greg Dziedzicki, Pharmacist, Boots Bristol Brislington, says: "*We are seeing about 3-4 patients daily on average being signposted from their surgery. Patients are really enjoying interacting with a pharmacist, they treat us seriously and can see how professional the service is that we are providing. Patients are very grateful for the advice they are receiving*

and are relieved they can be seen on the same day and don't have to wait for a GP appointment."
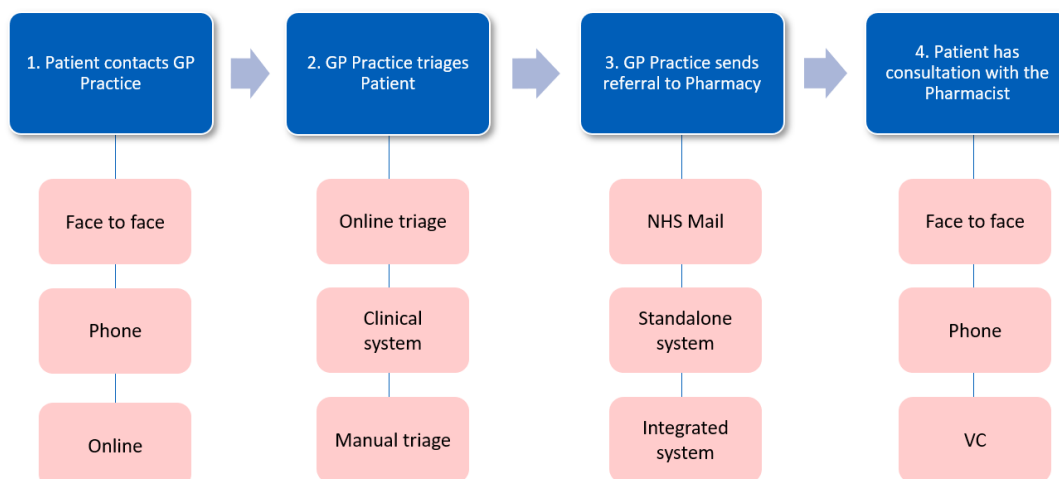

4 GP referral to the NHS CPCS

4.1   A diagram of the patient journey is included in Appendix A.

4.2   Patients who contact their GP practice for advice on the treatment of minor illnesses are assessed by the practice team to determine whether they are suitable for referral to the NHS CPCS. The NHS CPCS case mix of symptoms and minor conditions is set out in Appendix B and applies to all age groups. The GP referral to the NHS CPCS is not used for repeat prescription referrals as the expectation is that the practice will use the Electronic Prescription Service (EPS) as usual.

4.3   Sometimes a referral may be made when the pharmacy is closed or when a patient is able to wait until the next day for a consultation, depending on the need of the individual patient and if the pharmacy will be open again within the following 12 hours.

4.4   The patient is offered the referral and provided with details of pharmacies that provide the service, which are close to the patient's location. The patient selects which pharmacy they wish to attend. The patient's choice of pharmacy is paramount and should not be over-ruled by the practice.

4.5   A referral is sent to the pharmacy using a secure electronic message (e.g. either NHS mail or practice IT system which has the NHS CPCS referral capability). The referral contains information (see list in Appendix C) about why the patient is being referred, for the pharmacist to review ahead of or during the patient's consultation.

4.6   The standard process is that once the referral is made, the patient initiates the contact with the pharmacy. Alternatively, the patient can be advised to await contact from the pharmacist (if this approach has been formally agreed between the practice and the pharmacy). The consultation may also be able to take place remotely (i.e. telephone or video) with the patient at home. A clear narrative should be given to the patient, such as: *"Please wait to get a telephone call from the pharmacy to discuss your treatment. If they do not contact, you within the next X hours please ring the pharmacy".*

4.7   It may be possible for the practice to book into pharmacy appointment slots, if this can be agreed at PCN level. See section on 'Pharmacy Availability and Appointments' for considerations in approaching this locally.

4.8   If the pharmacist determines that the patient needs to be seen face-to-face, they will be asked to attend the pharmacy to enable the consultation to take place in a consultation room within the pharmacy according to infection prevention and control guidelines.

4.9   A patient being referred for a minor illness consultation can be offered clinical advice and treatment or, if necessary, onward referral such as to A&E, a GP or an Urgent Treatment Centre.

5 Making Referrals

5.1 Process for making referrals

5.1.1   Only patients who have been referred by their GP Practice are eligible to receive advice and treatment under this service, so an electronic referral must be made from the practice to the pharmacy.

5.1.2   The diagram below illustrates the range of ways the referral pathway from general practice to the NHS CPCS works. The specific way this will operate can differ depending on the local operational approach.

1. Patient contacts GP Practice	2. GP Practice triages Patient	3. GP Practice sends referral to Pharmacy	4. Patient has consultation with the Pharmacist
Face to face	Online triage	NHS Mail	Face to face
Phone	Clinical system	Standalone system	Phone
Online	Manual triage	Integrated system	VC

5.2 General practice triaging patients

5.2.1   Patients are already triaged by general practice teams to identify the reason for the contact. As part of this triage process and any other processes which may be in place, practice teams are able to determine whether the patient has a minor illness condition that is appropriate for referral to a community pharmacist.

5.2.2   Triage in the context of the GP referral pathway into the NHS CPCS can happen in two ways:

Streaming – this is carried out by non-clinicians using tools such as a protocol or an online assessment. To support the triage process, the referrer will need to be clear on the conditions that are suitable, and circumstances when it would not be appropriate to refer. Appendix B includes a list of possible symptoms groups that can be referred to a community pharmacist, and presentations which would generally be excluded from being referred for pharmacist consultation.

Clinical Triage – this involves a clinician directly assessing a patient, however the 'streaming' method (above) is encouraged so that the first contact the patient has with a clinician is with the pharmacist, rather than using the practice's clinical resource.

5.3 General practice sending the referral to the pharmacy

5.3.1 A secure digital referral of information must be made, rather than simply signposting the patient to attend the pharmacy. As part of the NHS CPCS service specification, the pharmacist is expected to make contact with the patient on the same day the referral is received. If no data is transferred across to the pharmacy, the patient is not included in the NHS CPCS service.

5.3.2 Some IT systems enable integration between the practice and the pharmacy so that referral information is automatically populated, whereas other approaches require more manual processing. Practices are encouraged to discuss the various system options which exist locally at a PCN level.

5.3.3 A minimum core set of information will be required to be sent from the practice to the pharmacy, regardless of which electronic referral method is used. This is to ensure that the relevant information is transferred for a consultation to be able to take place at the pharmacy. Appendix C describes the standard information set to be included when the referral is sent.

5.3.4 Once a patient has been triaged for an NHS CPCS consultation the referral may be sent in one of three ways. Using any one the referral routes below will be less resource intensive than the patient being seen within the practice.

NHS mail

Open up NHS Mail → Complete referral template → Select pharmacy to send to → Send email to pharmacy

Standalone system

Open webpage/portal → Complete referral information → Select pharmacy to send to → Send referral to pharmacy

Integrated system (e.g. GP clinical system)

Click 'refer' → Select pharmacy to send to → Click 'send' – referral sent to pharmacy
5.3.5 **NHS Mail (email) referrals**

The referral information received by NHS mail will be manually entered into the NHS CPCS IT system at the pharmacy once this information is received from the practice, even if the patient does not attend (DNA). This is to ensure 'safety netting' and good governance. See Appendix C for a referral template. The NHS mail acceptable use policy explains that when using NHS mail for sending sensitive information you should always request a delivery and read receipt, so that you can be sure the information has been received safely. This is especially important for time-sensitive information such as referrals.

5.3.6 **IT system referrals (standalone or integrated systems)**

Referrals may be made using a clinical IT system that enables the transfer of information to a pharmacy. This system may be integrated as part of the GP practice's system solution – and an integrated option is available as part of the majority of GP IT systems - or it may be a standalone referral system such as a separate web page. It is suggested that email contact information for pharmacies is available at the general practice for contingency purposes, even if the referral is being made by a GP IT system. See Appendix C for a referral template.

5.4 Recording referral details in the general practice system

5.4.1 The clinical record should be updated by the practice to show that the patient has been offered a community pharmacist consultation and whether the referral has been made to the pharmacy (i.e. the patient accepted). It is good practice to record the referral information in the same way that referrals are recorded when sent to other clinical services and clinicians.

5.5 Patient consultation at the pharmacy

5.5.1 Consultations with the pharmacist can be face-to-face in the pharmacy's consultation room or conducted remotely (telephone or video) with the patient at home. As part of the pharmacist consultation, patients can be offered clinical advice and treatment, signposting or escalation to another healthcare provider (such as 999, A&E, Urgent Treatment Centre or their own GP). They may also be supplied with an over the counter product. If the patient wishes to make a purchase, the pharmacy's own charges for the item will apply (it is not charged to the NHS or provided free of charge to the patient). The NHS supply of an over the counter product is not included in the NHS CPCS but some pharmacies may be commissioned by their CCG or local authority to supply specified medicines for minor conditions as part of a local NHS service.

6 Pharmacy Availability and Appointments

6.1   Pharmacies accepting NHS CPCS referrals from general practice will need to keep the practice(s) informed of their opening times. This includes details of opening times if they differ throughout the week, appointment availability (if they offer this), the address where the consultation will be provided, public telephone number and non-public telephone number where available (which the practice may use to speak to the pharmacist directly).

6.2   The practice must be kept informed if the pharmacy is temporarily withdrawn from providing the NHS CPCS service (in exceptional circumstances) and would not be able to receive referrals during that time. The practice and PCN should be notified in advance (if possible) of any changes and when the service is likely to resume.

6.3   It is not a requirement that a pharmacy appointment (designated time or timeslot) is arranged, but the opportunity to facilitate this could be explored as part of discussions with the PCN. If the option of making appointment slots available does not exist, patients can still be referred to the service and expect a consultation with the pharmacist on the same day, or next day if the pharmacy re-opens within 12 hours.

6.4   Appointment timings could be pre-agreed by the pharmacy, so that the practice is aware of availability. Patients may attend the pharmacy in person, or the consultation may take place remotely with the patient at home.

6.5   If there are multiple practices making referrals into the pharmacy, then it will need to be considered through PCN discussions how practices will be kept informed of changes to booked appointment slots.

7 PCN Engagement and Governance Arrangements

7.1   GP and PCN governance arrangements to support the GP referral pathway to NHS CPCS are detailed in Appendix E. PCNs will be the driving force for implementing and governing the GP referral into the NHS CPCS and the referral process should be developed and led ideally at PCN level so it is consistent across practices and pharmacies.

7.2   Clinical and operational responsibilities need to be identified and agreed within the practices and pharmacies. It is important that the full team at both the practice and the relevant pharmacies are aware of what is being introduced, how the service will operate and any daily activity that is required. Regular meetings with local colleagues are suggested to establish how to implement the referral pathway.

7.3   Working in partnership with the PCN and Local Pharmaceutical Committee, practice staff should be trained (as part of their continuing professional development) and supported with information materials as set out in Appendix D. It is key that practice staff are aware of the role and skills of pharmacists so that they have trust and confidence when making referrals and can explain the process to the patient. For instance, all pharmacists

are trained for five years in managing minor illnesses, and they are experts in the use of medicines.

7.4 Experience from the pilots has demonstrated that referral volumes could be low initially as confidence in the process develops.

7.5 Referrals and processes should be monitored by practice teams to check how confident staff are feeling, to identify what works well or barriers that need to be addressed.

8 Liaising with Patients

8.1 Prior to referrals being made

8.1.1 Patients should be kept informed about the practice making referrals to the pharmacy. This is both to prepare them in advance of when the service is launched, as well as what happens at the point that a referral is made.

8.1.2 Suggested content for web pages, patient information sheets, reception team scripts, digital screens and social media messages are set out in Appendix D.

8.1.3 Before the practice begins to make referrals, the practice answer phone message could be changed so that patients are advised that the reason for an appointment is going to be asked, to enable the appropriate care. This may also apply to messages conveyed to patients as part of online practice access. Potential wording for an answer phone message is provided in Appendix D

8.2 Information given to patients at the point of referral

8.2.1 At the point of referral, the patient needs to be given information about the NHS CPCS service and what they can expect from the pharmacist consultation, which clearly explains the service (without jargon), as well as next steps for accessing the patient's selected pharmacy. Appendix D provides further information.

8.2.2 Referrals should only be made where the patient has agreed to this i.e. provided consent to be referred to the pharmacy of their choice for a consultation

8.2.3 Staff should have information and resources available to support consistent and accurate information being recorded and provided to the patient, and which covers the following points:

- Confirming patient information (telephone number and presenting complaint) as set out in Appendix C.
- The pharmacy telephone number and/or address should be given depending on whether the consultation is intended to happen with the pharmacist remotely, or if the patient will be visiting the pharmacy.
- There may be the option within the practice's clinical system to send a notification to the patient's mobile phone, if the patient consents to this.

- The clinical consultation with the pharmacist can take place remotely with the patient at home or face to face in the consultation room. The patient should be advised that as part of this consultation, the pharmacist will discuss the patient's symptoms, take a brief medical history and run through any red flags which may be associated with the presenting condition. The pharmacist will then make a clinical decision as to what is the best course of action for the patient.

- The patient should be advised about attending or contacting the pharmacist within a certain time period. If the patient does not make contact as expected, the pharmacist will make efforts to contact the patient using contact details set out in the referral form.

- Advising the patient to let the pharmacy know that they have been referred by the practice.

8.3 Patients not consenting to share information or declining the NHS CPCS referral

8.3.1 Some patients may not want to disclose what their clinical concern is or may decline to be referred to the pharmacy. There may be various reasons for this, and practice staff should be confident in addressing this and offering reassurance, so that patient concerns can be mitigated where possible. Patient's wishes should be respected throughout this process.

8.3.2 The reasons for patients declining a referral to pharmacy should be captured to identify how issues could be addressed going forward, so that patients are successfully referred into the service when appropriate. Sharing learning about the patient experience will inform any local improvements to the process.

9 Pharmacy Communicating Back to the Practice

9.1 Pharmacist escalating patients

9.1.1 If during the consultation the pharmacist determines that it is clinically appropriate to escalate the patient back to the patient's registered practice (for a same day or non-urgent appointment), there should be locally agreed processes in place for the pharmacist to facilitate patient access. The pharmacist will use their clinical judgement to decide the urgency of the referral. An example process might include sharing with the pharmacy a dedicated private line/ number into the practice.

9.1.2 Pharmacists will not give patients the expectation of any specific treatment, e.g. antibiotics, or length of time it will take to access general practice.

9.1.3 Full details about the signposting/escalation process and the information pharmacies are expected to provide to practices post-consultation is available in the NHS CPCS service specification.

9.2 Post-event message (PEM)

9.2.1   A post-event message is a report about the patient's encounter with the service that is sent to general practice where the patient is registered after the consultation has taken place with the pharmacist.

9.2.2   Pharmacists will use their clinical judgement to determine when a PEM is sent back to the registered GP or based on what has been agreed as part of PCN governance arrangements, which provides information about the patient interaction and outcomes from the pharmacist consultation. Whilst it is good practice for all consultation outcomes to be sent to the general practice, this can be discussed as part of PCN arrangements. It is recommended to send a PEM after all consultations as the process is first established.

9.2.3   The PEM will preferably be sent via a secure digital route, as either NHS mail (as a PDF) or via an integrated method from the pharmacy system into the practice's system. The practice should ensure that the patient's clinical record is updated with this information.

10 Reporting and monitoring

10.1 Reporting to NHS England and NHS Improvement

10.1.1   When the referral is received by the pharmacy, the referral details are recorded in the pharmacy clinical system in a format that can be readily shared, which will then be monitored by NHS England and NHS Improvement as part of usual assurance processes for community pharmacy.

10.2 Monitoring locally

10.2.1   As part of the service governance arrangements set up by the PCN, data should be monitored, so that there is visibility of the number of referrals being made, and the amount of practice appointment time which is being used more appropriately. Doing this will encourage staff to continue to make referrals to the NHS CPCS. Referral numbers (per registered patient population) can be compared across different practices to see where referrals are working well and why.

10.2.2   Referral volumes can be monitored by identifying how many patients were referred through from the practice, and/or how many the pharmacy recorded as received in their system.

10.2.3   Missed opportunities (when patients could have been referred into NHS CPCS but were not) should be identified and the reasons for this understood. This can be monitored and discussed at PCN level.
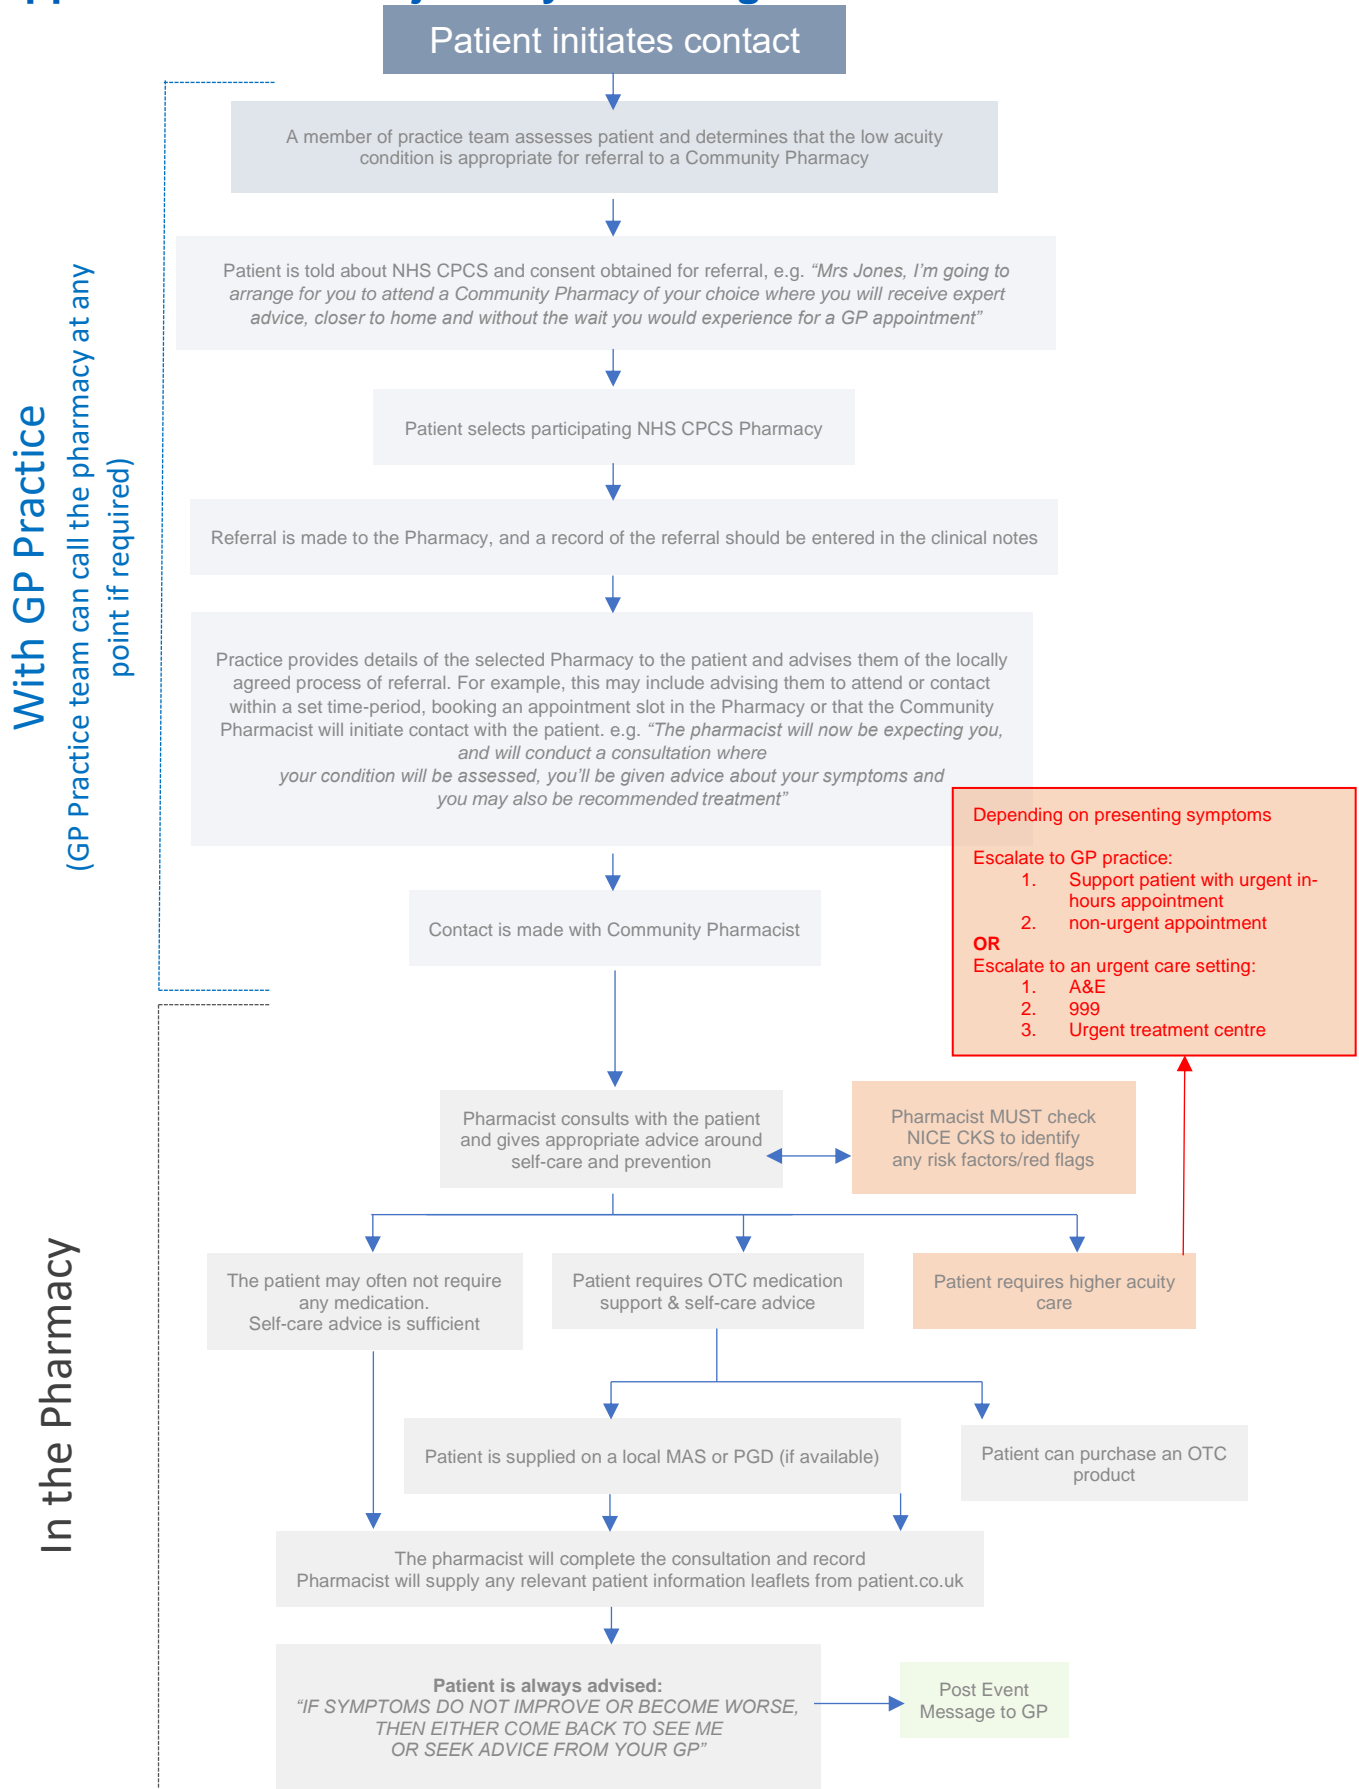

11 Further support

For further information please contact your:

- Regional implementation lead (NHS England and NHS Improvement)
- Pharmacy Regional Integration Lead (NHS England and NHS Improvement)
- Access Improvement Programme team (NHS England and NHS Improvement)
- Primary Care Network (PCN)
- Local Pharmaceutical Committee (LPC)
- Local Medical Committee (LMC)

The following resources are also available:

- NHS England and NHS Improvement website
- GP referral to NHS CPCS pilot case study
- NHS CPCS Service Specification
- NHS CPCS Pharmacy Toolkit

Appendix A: Patient journey flow diagram

Patient initiates contact

With GP Practice
(GP Practice team can call the pharmacy at any point if required)

A member of practice team assesses patient and determines that the low acuity condition is appropriate for referral to a Community Pharmacy

Patient is told about NHS CPCS and consent obtained for referral, e.g. *"Mrs Jones, I'm going to arrange for you to attend a Community Pharmacy of your choice where you will receive expert advice, closer to home and without the wait you would experience for a GP appointment"*

Patient selects participating NHS CPCS Pharmacy

Referral is made to the Pharmacy, and a record of the referral should be entered in the clinical notes

Practice provides details of the selected Pharmacy to the patient and advises them of the locally agreed process of referral. For example, this may include advising them to attend or contact within a set time-period, booking an appointment slot in the Pharmacy or that the Community Pharmacist will initiate contact with the patient. e.g. *"The pharmacist will now be expecting you, and will conduct a consultation where your condition will be assessed, you'll be given advice about your symptoms and you may also be recommended treatment"*

Contact is made with Community Pharmacist

Depending on presenting symptoms

Escalate to GP practice:
1. Support patient with urgent in-hours appointment
2. non-urgent appointment

OR

Escalate to an urgent care setting:
1. A&E
2. 999
3. Urgent treatment centre

In the Pharmacy

Pharmacist consults with the patient and gives appropriate advice around self-care and prevention

Pharmacist MUST check NICE CKS to identify any risk factors/red flags

The patient may often not require any medication. Self-care advice is sufficient

Patient requires OTC medication support & self-care advice

Patient requires higher acuity care

Patient is supplied on a local MAS or PGD (if available)

Patient can purchase an OTC product

The pharmacist will complete the consultation and record Pharmacist will supply any relevant patient information leaflets from patient.co.uk

Patient is always advised:
"IF SYMPTOMS DO NOT IMPROVE OR BECOME WORSE, THEN EITHER COME BACK TO SEE ME OR SEEK ADVICE FROM YOUR GP"

Post Event Message to GP

Appendix B: NHS CPCS symptom groups

Presenting criteria which would generally lead to exclusion from referral to NHS CPCS include:

- Red flags
- Patients under 1 years old
- Anyone presenting with high temperature unresponsive to antipyretic medicines (self-declared)

NOTE: Individual GP practices will determine which symptom groups are indicative of a low acuity minor illness they will refer to a pharmacist. Some total triage systems may define certain symptoms and conditions differently but experience from the pilots has shown a PCN approach to agreeing any additional symptoms or definitions is advisable.

Community pharmacies will use NICE Clinical Knowledge Summaries to manage the presenting condition.

The following list is not exhaustive but reflects the case mix based on current NHS 111 referrals:

Acne, Spots and Pimples
Allergic Reaction
Ankle or Foot Pain or Swelling
Arm Pain or Swelling
Athlete's Foot
Bites or Stings, Insect or Spider
Blisters
Cold or Flu
Constipation
Cough
Diarrhoea
Earache, Ear Discharge or Ear Wax
Eye, Red or Irritable
Eye, Sticky or Watery
Hair Loss
Headache
Hip, Thigh or Buttock Pain or Swelling
Knee or Lower Leg Pain or Swelling
Lower Back Pain
Lower Limb Pain or Swelling
Mouth Ulcers
Rectal Pain, Swelling, Lump or Itch
Shoulder Pain
Skin, Rash
Sleep Difficulties
Sore Throat and Hoarse Voice
Tiredness (Fatigue)
Toe Pain or Swelling
Vaginal Discharge
Vaginal Itch or Soreness
Vomiting
Wound Problems - management of dressings
Wrist, Hand or Finger Pain or Swelling

Appendix C: Information to be included in the referral

- Referrer name and position
- Patient name
- Patient date of birth (DOB)
- Patient gender
- Patient's contact telephone number
- Patient's registered general practice
- Where the referral is being made to
- Patient's presenting minor illness complaint or issue
- Date / time of referral
- NHS number

This template can be used by the general practice when the referral is manually sent to the pharmacy. It ensures necessary information fields are captured, regardless of which electronic referral method is used.

NOTE: Individual GP practices will determine which symptom groups they will refer to pharmacy.

Content	Description
Referrer name and position	*Details of the person making the referral.*
Patient name	*The full name of the patient.*
Date of birth (DOB)	*The date of birth of the patient in full or format DD-MM-YYYY.*
Gender	*The patient's gender. As the patient wishes to portray themselves.*
Contact telephone number	*Telephone contact details of the patient. Can include mobile, work and home number if available.*
GP name	*The details of the GP practice where the patient is registered.*
Referral to	*Name of the pharmacy that the referral is being sent to.*
Presenting complaint or issue *(see tick list below)*	*The description of the health problem/ issue experienced by the patient precipitating referral.*
Date / time of referral	*The date and time when the referral is made.*
NHS number	*The unique identifier for a patient within the NHS in England and Wales.*
Comments	*Free text box for receptionist to add any notes from their conversation.*

Hip, Thigh or Buttock Pain or Swelling		Other (please state what):	

Appendix D: Communications materials

These communications materials can support practices in their messaging to patients.

Content for websites, digital screens or printed information

This message could be communicated to patients through available communications channels, such as posting on the practice website.

"Did you know…?

We are participating in a new approach to improve access for patients to GP appointments. The aim is to direct patients to the most appropriate healthcare professional, which may be a GP or a pharmacist.

From [insert when] if your symptoms could be resolved by a booked consultation with the pharmacist instead of the GP, you will be given a same-day referral to a pharmacy of your choice.

We think this is a good thing – once you see how great your local pharmacist is – they are highly trained and skilled clinicians experienced in treating minor illnesses – we don't think you'll look back.

This will also help us to free up GP appointments for people with more complex health needs and ensure that everyone gets treated at the right time, by the right healthcare professional.

We are keen to hear what you think and will be listening to your comments and feedback about your experience of using this service.

Poster about the role of reception teams

This poster explains to patients how receptionist staff will ask them questions confidentially, to ensure the correct level of care:

Practice answer phone message

The following message could be part of the practice's Interactive Voice Response (IVR) while the patient is kept on hold.

"Hello, this is the [x] surgery. We wanted to let you know we have asked the reception team to ask you a few questions about the reason you are calling today, this is to help us in identifying the best person to help you. It may involve you being referred to a community pharmacist or other members of our team. Now let's get you through to speak to one of our team".

Further resources

These resources on the Public Health England (PHE) website are available to NHS staff to support with patient communications: https://campaignresources.phe.gov.uk/resources/campaigns/73/resources/4959

This public facing website can be used to link from your practice website:

Top tips for implementation from the BNSSG pilot

Appendix E: GP and PCN Governance arrangements to support the GP referral pathway to NHS CPCS

It is important to establish robust local clinical governance arrangements for GP referrals into NHS CPCS and particularly that those arrangements are integrated with existing governance arrangements across all stakeholders and settings.

The Update to the GP Contract Agreement 2020/21 – 2023/24 published in February 2016 highlighted the ambition to take forward a new refreshed and updated Access Improvement Programme. **The Access Improvement Programme** will be the important vehicle for supporting local implementation across Primary Care Networks (PCNs) working within their constituent Integrated Care Systems (ICSs) supported by Regional teams and any associated governance arrangements.

Learnings from our pilot sites and early adopters to support the implementation of the referral pathway in establishing a consistent PCN approach can be found here: https://future.nhs.uk/P_C_N/grouphome
